

Harvest tips for frosty weather:

If you anticipate a frost, pull the whole plant, and hang it by the roots upside down in a cool dry space until pods turn brown.

1. Let pods dry and turn brown before harvesting, about six weeks past the fresh eating stage.

photo credit: <https://melissaknorris.com/>

2. Open pods by hand or, if working with large amounts, place between tarp sheets and dance on them!
3. Thrash and winnow as needed. Use a screen and/or a little wind to separate seeds from chaff.

4. Place DRY seeds in envelope or jar; LABEL with seed variety & year; store in cool, dark, dry location.** Plant in spring!

***These seeds will stay viable for at least 3-5 years.*
